

# ShowFormResults Action (v.2.5)

by Nate Baldwin

This action was created specifically to function with our PHP form processing program, NateMail. The NateMail script allows you to collect user input in a form and have the results emailed to you. You also have the option of setting up your own custom re-direct page for after the form has been submitted, and this action will let you display the form results on your custom redirect page.

For information on downloading and installing NateMail, [CLICK HERE](#).

## Here's how to install the action:

Install the .ation file into a new folder named "MindPalette" (if you don't already have a MindPalette folder in your GoLive actions). Put the MindPalette folder into your GoLive actions folder, which you can find here on your computer:

(Main GoLive Folder) / Modules / JScripts / Actions

## Here's how to use the action on your page:

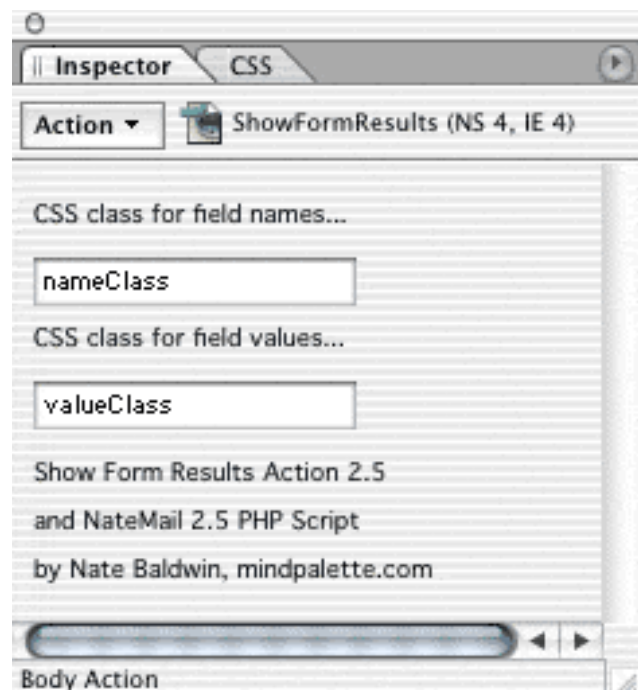

**IMPORTANT:** To use this action, please make sure you have the latest version 2.5 of the NateMail.php script or later, otherwise your view results will not be as expected.

Using the action is very simple. Open your HTML page in GoLive. Drag a body action tag (from the Objects Palette > Smart > Body Action) to anywhere on your document that you'd like the form results to be displayed in.

In the Inspector, point the action to your copy of the "ShowFormResults" action.

Now as long as your form is pointing to this new page as the redirect location, the results should be passed to the action by the NateMail script and displayed where you specified.

As seen in the palette image above, you are now able to specify a CSS class from the style sheet on your page to better control the display appearance of the field names and the field values, independently.

**That should do it!** If you have any questions or suggestions, use our [Support Forum](#) and post a new topic. We'll do our best to answer your questions as quickly as possible.
